

Release Date: July 21, 2011

Title: Atmosphere Engineering is MAKING MONEY (with the US Mint)

Atmosphere Engineering has successfully delivered a custom designed Nitrogen/Hydrogen mixing panel for the United States Mint in Philadelphia, PA. The panel will be used to develop new processing techniques for the plating and processing of currency (coins). In cooperation with the US mint, Atmosphere Engineering fluid control engineers designed a process control solution using Solidworks™ 3d modeling software to help integrate the system directly into the space requirements while ensuring that all safety devices and solenoids were incorporated to meet NFPA 86 guidelines.

Atmosphere Engineering designs and manufactures integrated flow control devices and solutions for industrial applications.

The US Mint designs and manufactures money.
