

**Release Date:** January 13, 2011

**Title: Successful Startup for Aichelin / Mercedes Project in Brazil**

Atmosphere Engineering is proud to announce that the first three Aichelin endothermic gas generators were successfully started last week at the Mercedes facility in Sao Paulo, Brazil. The generators incorporated custom designed EndoInjector control systems utilizing Siemens PLC controllers provided by Atmosphere Engineering in Milwaukee, Wisconsin.

In addition to the generator control systems, Atmosphere Engineering also provided custom designed dual-language operator interface screens for each generator and a centralized touch-screen computer panel to provide Mercedes furnace operators with a single location to supervise and control their entire system of gas generation equipment.

The startup was so successful that this week Mercedes has already contracted Aichelin to replace the rest of their gas generation equipment throughout their entire facility by the end of 2011. We are very proud to be working with successful companies like Aichelin, Mercedes, and Maxitrate in Brazil and look forward to building these relationships into the future.
