Title: Atmosphere Engineering Products Meet NFPA 86-2011 Standards

The National Fire Protection Association recently released the NFPA 86 (2011 Edition) “Standards for Ovens and Furnaces” which is now available for purchase at www.nfpa.org. After a thorough review, Atmosphere Engineering can confidently state that all of our products and systems meet the newly updated standard. “We continue to use the NFPA 86 publication as our standard reference for every product we design” says Jason Jossart, President of Atmosphere Engineering.

Atmosphere Engineering recently published a study of the flow meter equipment requirements in the new standards. The study is available for download at www.atmoseng.com/tech_index.htm. The newly published technical documents details the exact requirements that flow metering equipment must meet to achieve NFPA86 approval.

Atmosphere Engineering strongly recommends that every thermal processing operator and technician get a copy of the NFPA 86 standards. It is one of the primary tools we use at AEC to ensure the safety of all personnel and property in this industry.
